## How to show widescreen websites in XSitePro

You may have noticed that this site is optimized for widescreen viewing, yet the basic XSitePro control panel does not show this option.

### How is this done Pete?

Here I show you exactly how to achieve widescreen sites with XSitePro, our example uses cpanel hosting, like [hostgator](#).

1. Firstly, you need to find you .css file in your web server account.
2. If you have not altered this, it will be named xsp.css
3. The file will be located, along with all your other site files in public\_html, this is easy to find using file manager.
4. Click on the file name, then click edit file on your menu.
5. The new window opens up with an editing box inside.
6. Right ckick on the text, then save this code to notepad, call this file xsp.cssbak, you can also save this as a copy on your web server.
7. Find all the sentences with fixed widths, like this **width: 800px**
8. Replace the widths for % rather than px.

Please note, because you will be using percentages, rather than pixels, the total across page must total 100%

- ◊ [Home Business Opportunity Online](#)

**Below is the css code** from this very site, the percentages are highlighted, and you can see how they add up.

**Green on Yellow** creates a 90% screen to allow a background margin

**Red shows** 14% left panel, 74% center panel and 12% right = 100%

**Blue shows** percentage widths for the whole thing to work together.
